15 distinct pairs; 50 groups per pair. Reverse-order cells repeat the same observations.

$P_{\text{ind}} = 1 - (1 - p_a)(1 - p_b)$; blue: below reference; orange: above reference.

Both Collective variants use the original single-agent Collective reference.

Jeffreys: group rate only; Douglas remains a fixed published pooled reference.

Historical reference; differences also reflect changes in experimental setup. Uncertainty is not shown.
